# Lecture 1: Introduction to Reinforcement Learning

David Silver

#### Outline

- 1 Admin
- 2 About Reinforcement Learning
- 3 The Reinforcement Learning Problem
- 4 Inside An RL Agent
- 5 Problems within Reinforcement Learning

Lecture 1: Introduction to Reinforcement Learning

LAdmin

#### Class Information

- Thursdays 9:30 to 11:00am
- Website:

http://www.cs.ucl.ac.uk/staff/D.Silver/web/Teaching.html

■ Group

http://groups.google.com/group/csml-advanced-topics

■ Contact me: d.silver@cs.ucl.ac.uk

#### Assessment

- Assessment will be 50% coursework, 50% exam
- Coursework
  - Assignment A: RL problem
  - Assignment B: Kernels problem
  - Assessment = max(assignment1, assignment2)
- Examination
  - A: 3 RL questions
  - B: 3 kernels questions
  - Answer any 3 questions

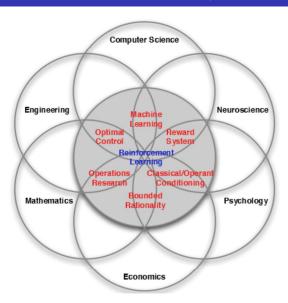

#### Textbooks

- An Introduction to Reinforcement Learning, Sutton and Barto, 1998
  - MIT Press, 1998
  - $\sim$  40 pounds
  - Available free online!
  - http://webdocs.cs.ualberta.ca/~sutton/book/the-book.html
- Algorithms for Reinforcement Learning, Szepesvari
  - Morgan and Claypool, 2010
  - $\sim 20$  pounds
  - Available free online!

 $http://www.ualberta.ca/{\sim} szepesva/papers/RLAlgsInMDPs.pdf$ 

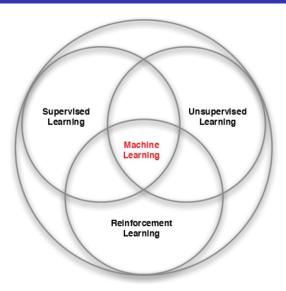

Lecture 1: Introduction to Reinforcement Learning
LAbout RL

### Many Faces of Reinforcement Learning

Lecture 1: Introduction to Reinforcement Learning
L-About RL

## Branches of Machine Learning

Lecture 1: Introduction to Reinforcement Learning

#### Characteristics of Reinforcement Learning

What makes reinforcement learning different from other machine learning paradigms?

- There is no supervisor, only a *reward* signal
- Feedback is delayed, not instantaneous
- Time really matters (sequential, non i.i.d data)
- Agent's actions affect the subsequent data it receives

Lecture 1: Introduction to Reinforcement Learnin

#### Examples of Reinforcement Learning

- Fly stunt manoeuvres in a helicopter
- Defeat the world champion at Backgammon
- Manage an investment portfolio
- Control a power station
- Make a humanoid robot walk
- Play many different Atari games better than humans

Lecture 1: Introduction to Reinforcement Learning
L-About RL

## Helicopter Manoeuvres

Lecture 1: Introduction to Reinforcement Learning
L-About RL

## Bipedal Robots

Lecture 1: Introduction to Reinforcement Learning

- About RL

Atari

Lecture 1: Introduction to Reinforcement Learning

L The RL Problem

#### Rewards

Reward

- lacktriangle A reward  $R_t$  is a scalar feedback signal
- Indicates how well agent is doing at step t
- The agent's job is to maximise cumulative reward

Reinforcement learning is based on the reward hypothesis

#### Definition (Reward Hypothesis)

 $A\!I\!I$  goals can be described by the maximisation of expected cumulative reward

Do you agree with this statement?

Lecture 1: Introduction to Reinforcement Learning

The RL Problem

Reward

#### Examples of Rewards

- Fly stunt manoeuvres in a helicopter
  - +ve reward for following desired trajectory
  - ve reward for crashing
- Defeat the world champion at Backgammon
  - +/-ve reward for winning/losing a game
- Manage an investment portfolio
  - +ve reward for each \$ in bank
- Control a power station
  - +ve reward for producing power
  - ve reward for exceeding safety thresholds
- Make a humanoid robot walk
  - +ve reward for forward motion
  - -ve reward for falling over
- Play many different Atari games better than humans
  - +/-ve reward for increasing/decreasing score

Lecture 1: Introduction to Reinforcement Learning

LThe RL Problem

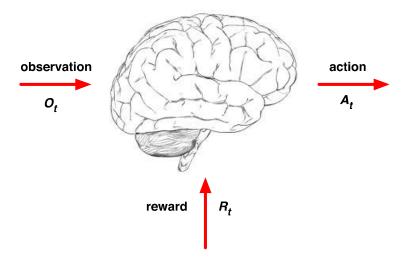

#### Sequential Decision Making

- Goal: select actions to maximise total future reward
- Actions may have long term consequences
- Reward may be delayed
- It may be better to sacrifice immediate reward to gain more long-term reward
- Examples:
  - A financial investment (may take months to mature)
  - Refuelling a helicopter (might prevent a crash in several hours)
  - Blocking opponent moves (might help winning chances many moves from now)

Lecture 1: Introduction to Reinforcement Learning

The RL Problem
Environments

## Agent and Environment

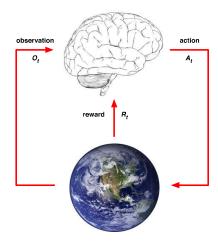

Lecture 1: Introduction to Reinforcement Learning

— The RL Problem

Environments

#### Agent and Environment

- At each step *t* the agent:
  - lacktriangle Executes action  $A_t$
  - lacktriangle Receives observation  $O_t$
  - Receives scalar reward  $R_t$
- The environment:
  - Receives action  $A_t$
  - Emits observation  $O_{t+1}$
  - lacksquare Emits scalar reward  $R_{t+1}$
- t increments at env. step

#### 

#### History and State

∟<sub>State</sub>

■ The history is the sequence of observations, actions, rewards

$$H_t = O_1, R_1, A_1, ..., A_{t-1}, O_t, R_t$$

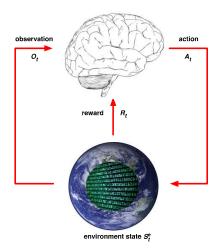

- $\blacksquare$  i.e. all observable variables up to time t
- i.e. the sensorimotor stream of a robot or embodied agent
- What happens next depends on the history:
  - The agent selects actions
  - The environment selects observations/rewards
- State is the information used to determine what happens next
- Formally, state is a function of the history:

$$S_t = f(H_t)$$

Lecture 1: Introduction to Reinforcer

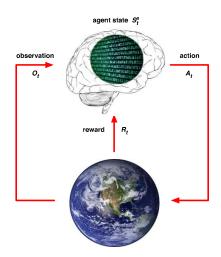

The RL Problem

#### Environment State

- The environment state  $S_t^e$  is the environment's private representation
- i.e. whatever data the environment uses to pick the next observation/reward
- The environment state is not usually visible to the agent
- Even if *S*<sup>e</sup><sub>t</sub> is visible, it may contain irrelevant information

#### Agent State

- The agent state  $S_t^a$  is the agent's internal representation
- i.e. whatever information the agent uses to pick the next action
- i.e. it is the information used by reinforcement learning algorithms
- It can be any function of history:

$$S_t^a = f(H_t)$$

#### Lecture 1: Introduction to Reinforcement Learn

#### Information State

An information state (a.k.a. Markov state) contains all useful information from the history.

#### Definition

A state  $S_t$  is Markov if and only if

$$\mathbb{P}[S_{t+1} \mid S_t] = \mathbb{P}[S_{t+1} \mid S_1, ..., S_t]$$

• "The future is independent of the past given the present"

$$H_{1:t} \rightarrow S_t \rightarrow H_{t+1:\infty}$$

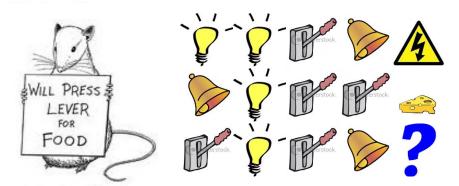

- Once the state is known, the history may be thrown away
- i.e. The state is a sufficient statistic of the future
- lacktriangle The environment state  $S_t^e$  is Markov
- lacktriangle The history  $H_t$  is Markov

Lecture 1: Introduction to Reinforcer

The RL Problem

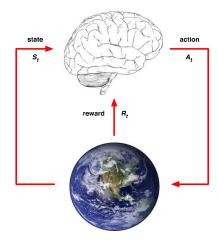

State

#### Rat Example

- What if agent state = last 3 items in sequence?
- What if agent state = counts for lights, bells and levers?
- What if agent state = complete sequence?

#### Fully Observable Environments

Full observability: agent directly observes environment state

$$O_t = S_t^a = S_t^e$$

- Agent state = environment state = information state
- Formally, this is a Markov decision process (MDP)
- (Next lecture and the majority of this course)

Lecture 1: Introduction to Reinforcement Learning └─The RL Problem

#### Partially Observable Environments

- Partial observability: agent indirectly observes environment:
  - A robot with camera vision isn't told its absolute location
  - A trading agent only observes current prices
  - A poker playing agent only observes public cards
- $\blacksquare \ \, \mathsf{Now} \,\, \mathsf{agent} \,\, \mathsf{state} \neq \mathsf{environment} \,\, \mathsf{state}$
- Formally this is a partially observable Markov decision process (POMDP)
- Agent must construct its own state representation  $S_t^a$ , e.g.

  - Complete history:  $S_t^a = H_t$  Beliefs of environment state:  $S_t^a = (\mathbb{P}[S_t^e = s^1], ..., \mathbb{P}[S_t^e = s^n])$  Recurrent neural network:  $S_t^a = \sigma(S_{t-1}^a W_s + O_t W_o)$

Lecture 1: Introduction to Reinforcement Learning

LInside An RL Agent

#### Major Components of an RL Agent

- An RL agent may include one or more of these components:
  - Policy: agent's behaviour function
  - Value function: how good is each state and/or action
  - Model: agent's representation of the environment

### Lecture 1: Introduction to Reinforcement Learning LInside An RL Agent

#### Policy

- A policy is the agent's behaviour
- It is a map from state to action, e.g.
- Deterministic policy:  $a = \pi(s)$
- Stochastic policy:  $\pi(a|s) = \mathbb{P}[A_t = a|S_t = s]$

#### Lecture 1: Introduction to Reinforcement Learnin

### Value Function

- Value function is a prediction of future reward
- Used to evaluate the goodness/badness of states
- And therefore to select between actions, e.g.

$$v_{\pi}(s) = \mathbb{E}_{\pi}\left[R_{t+1} + \gamma R_{t+2} + \gamma^2 R_{t+3} + ... \mid S_t = s\right]$$

Lecture 1: Introduction to Reinforcement Learn

Example: Value Function in Atari

#### Lecture 1: Introduction to Reinforcement Learning L Inside An RL Agent

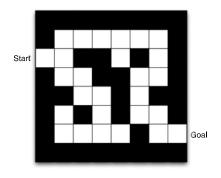

#### Model

- A model predicts what the environment will do next
- lacksquare  $\mathcal P$  predicts the next state
- lacksquare  $\mathcal R$  predicts the next (immediate) reward, e.g.

$$\mathcal{P}_{ss'}^{a} = \mathbb{P}[S_{t+1} = s' \mid S_t = s, A_t = a]$$
  
$$\mathcal{R}_{s}^{a} = \mathbb{E}[R_{t+1} \mid S_t = s, A_t = a]$$

Lecture 1: Introduction to Reinforcement Learning
Linside An RL Agent

### Maze Example

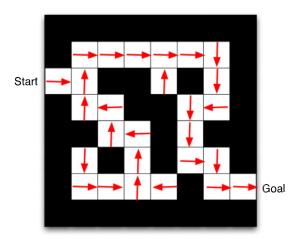

■ Rewards: -1 per time-step

Actions: N, E, S, W

■ States: Agent's location

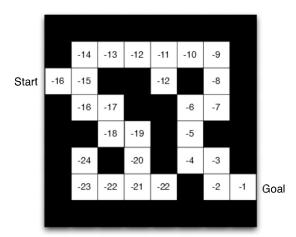

Lecture 1: Introduction to Reinforcement Learning
Linside An RL Agent

# Maze Example: Policy

lacksquare Arrows represent policy  $\pi(s)$  for each state s

# Maze Example: Value Function

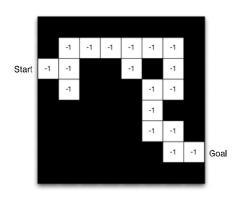

lacksquare Numbers represent value  $v_\pi(s)$  of each state s

Lecture 1: Introduction to Reinforcer

Inside An RL Agent

#### Maze Example: Model

- Agent may have an internal model of the environment
- Dynamics: how actions change the state
- Rewards: how much reward from each state
- The model may be imperfect
- $\blacksquare$  Grid layout represents transition model  $\mathcal{P}^{\text{a}}_{ss'}$
- Numbers represent immediate reward  $\mathcal{R}_s^a$  from each state s (same for all a)

Lecture 1: Introduction to Reinforcement Learning
L Inside An RL Agent

#### Categorizing RL agents (1)

- Value Based
  - No Policy (Implicit)
  - Value Function
- Policy Based
  - Policy
  - No Value Function
- Actor Critic
  - Policy
  - Value Function

Lecture 1: Introduction to Reinforcement Learning
Linside An RL Agent

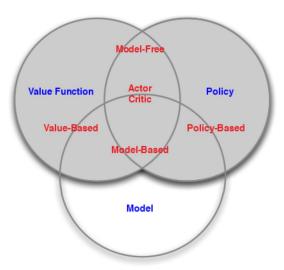

### Categorizing RL agents (2)

- Model Free
  - Policy and/or Value Function
  - No Model
- Model Based
  - Policy and/or Value Function
  - Model

Lecture 1: Introduction to Reinforcement Learning

LInside An RL Agent

## RL Agent Taxonomy

Lecture 1: Introduction to Reinforcement Learning

— Problems within RL

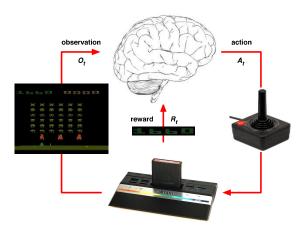

#### Learning and Planning

Two fundamental problems in sequential decision making

- Reinforcement Learning:
  - The environment is initially unknown
  - The agent interacts with the environment
  - The agent improves its policy
- Planning:
  - A model of the environment is known
  - The agent performs computations with its model (without any external interaction)
  - The agent improves its policy
  - a.k.a. deliberation, reasoning, introspection, pondering, thought, search

Lecture 1: Introduction to Reinford

### Atari Example: Reinforcement Learning

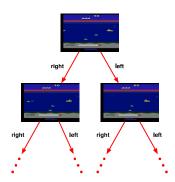

- Rules of the game are unknown
- Learn directly from interactive game-play
- Pick actions on joystick, see pixels and scores

Lecture 1: Introduction to Reinforcement Learning

Problems within RL

#### Atari Example: Planning

- Rules of the game are known
- Can query emulator
  - perfect model inside agent's brain
- If I take action *a* from state *s*:
  - what would the next state be?
  - what would the score be?
- Plan ahead to find optimal policy
  - e.g. tree search

Lecture 1: Introduction to Reinforcement Learning

Problems within RL

### Exploration and Exploitation (1)

- Reinforcement learning is like trial-and-error learning
- The agent should discover a good policy
- From its experiences of the environment
- Without losing too much reward along the way

Lecture 1: Introduction to Reinforcement Learning

— Problems within RL

### Exploration and Exploitation (2)

- Exploration finds more information about the environment
- Exploitation exploits known information to maximise reward
- It is usually important to explore as well as exploit

Lecture 1: Introduction to Reinforcement Learning
Problems within RL

#### Examples

#### ■ Restaurant Selection

Exploitation Go to your favourite restaurant Exploration Try a new restaurant

Online Banner Advertisements

Exploitation Show the most successful advert Exploration Show a different advert

Oil Drilling

Exploitation Drill at the best known location Exploration Drill at a new location

■ Game Playing

Exploitation Play the move you believe is best Exploration Play an experimental move

Lecture 1: Introduction to Reinforcement Learning

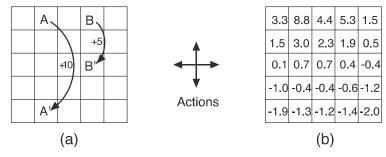

Problems within RL

#### Prediction and Control

- Prediction: evaluate the future
  - Given a policy
- Control: optimise the future
  - Find the best policy

Lecture 1: Introduction to Reinforcement Learn

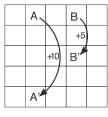

### Gridworld Example: Prediction

What is the value function for the uniform random policy?

Lecture 1: Introduction to Reinforcement Learn
L-Problems within RL

## Gridworld Example: Control

22.0	24.4	22.0	19.4	17.5
19.8	22.0	19.8	17.8	16.0
17.8	19.8	17.8	16.0	14.4
16.0	17.8	16.0	14.4	13.0
14.4	16.0	14.4	13.0	11.7

<b>→</b>		<b>←</b>		<b>←</b>
	1			<b>←</b>
			<b>↓</b>	
Ĺ,	1	<b>_</b>	<b></b>	<b>†</b>
<b>Ĺ</b> ₊	1	<b>_</b>	<b>_</b>	<b>1</b>

a) gridworld

b)  $v_*$  c)  $\pi_*$ 

What is the optimal value function over all possible policies? What is the optimal policy?

Lecture 1: Introduction to Reinforcement Learning

Course Outline

#### Course Outline

- Part I: Elementary Reinforcement Learning
  - Introduction to RL
  - 2 Markov Decision Processes
  - 3 Planning by Dynamic Programming
  - 4 Model-Free Prediction
  - 5 Model-Free Control
- Part II: Reinforcement Learning in Practice
  - 1 Value Function Approximation
  - 2 Policy Gradient Methods
  - 3 Integrating Learning and Planning
  - 4 Exploration and Exploitation
  - **5** Case study RL in games
